Instruction for HW6

Part 1.

Hint: You may want to use xpathSApply(root, path, xmlValue) function in extracting specific attribute from tree, and for you need to write path by yourself.

There is a reference posted by Sierra on Open Discussion board, and it may help you to write these paths.

When you write the path, see the link you use in part 1, and find the structure for specific attribute.

Part 2.

For this part, the function you may use: newXMLDoc, newXMLNode.

When you create the root, call it "kml", and use http://www.opengis.net/kml/2.2 as namespaceDefinitions.

The basic structure is shown below:
